This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, a peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used sequence and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (HUMA) HUMAN GENOME SCI INC.

(INCY-) INCYTE PHARM INC
This represents a human DnaJ-like protein, HSPJ2. The invention provides two human DnaJ-like proteins which are heat shock proteins J1 and J2 (HSPJ1 and HSPJ2) and nucleic acid sequences encoding the proteins. Host cells containing a vector comprising the nucleic acids are used for the production of recombinant proteins. Recombinant HSPJ1 and HSPJ2 are used to raise Ab, therapeutically and to screen for specific binding agents. Antagonists are used to treat or prevent a wide variety of solid cancers, leukaenia and lymphoma; immune disorders (typical of many disclosed are acquired immune deficiency syndrome, allergy, asthma, Crohn's disease, diabetes mellitus, multiple sclerosis, rheumatoid arthritis, microbial and parasitic infections) and inflammation. Agonists may be used to treat or prevent tissue damage, e.g. in cases of ankylosing spondylitis, heart attack, ischaemia, UV exposure, insulin-dependent diabetes and for wound

Claim 13; Pages 56-57; 76pp; English.

The sequence is that of a secreted protein from a human fetal

Ridney clone AK296. Such a sequence is predicted to have biological

activities which would make them suitable for treating, preventing of

ameliorating medical conditions in humans and animals, although no

supporting data is given. Suggested activities include nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             healing, and may be expressed from a vector containing the nucleic acids. Fragments of the nucleic acids are used as primers and probes for detecting and quantifying the HSPJ-encoding nucleic acid in usual hybridisation and/or amplification assays, therapeutically as antisense, triplex-forming or ribozyme molecules, and for chromosome mapping
                                                                                                                                                                                                                            and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. It is also stated to be useful for gene

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, a peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also used for the production of antibodies. The products can also be used detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GHPO protein; Helicobacter infection; gastroduodenal disease; peptic ulcer disease. Claims 37, 41; Bage 271-272; 339pp; English.
Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 97 ORFs are shown. The proteins are variously cell envelope proteins, cytoplasmic proteins, secreted proteins or other cellular proteins.
Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                  Yll104 standard; Protein;

CC Recombinant or substantially pure preparations of H. pylori polypeptides CC are disclosed, together with the nucleic acids encoding them. In all, CC 97 ORFs are shown. The proteins are variously cell envelope proteins, CC vaccines containing the nucleic acids or proteins are claimed, as are CC vaccines containing the nucleic acids or proteins are claimed, as are CC robes containing at least 8 nucleotides from the nucleic acid CC sequences. The vaccines are useful for treating or reducing the risk of CC detecting the presence of Helicobacter in a sample. The products are CC used used to screening for compounds having the ability to interfere CC with the H. pylori life cycle or to inhibit H. pylori infection.

The sequence represents a mouse cysteine string protein encoded by a gene isolated from mouse T-cell clones 11.3.7 and 12.2 by a new procedure for identification of genes associated with anergy. The protein is expressed in resting T-cells but not in anergic T-cells To isolate proteins of this type, differential display is first performed by generating cDNA from polyA+ mRNA with an oligo-dT primer with 2 variable anchor nucleotides at the 3'-end, e.g.

Thir86, using reverse-transcriptase. The resulting cDNA promise in the communication of the content o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       populations are amplified by the polymerase chain reaction, using the same oligo-dr primer and a 5'-primer which includes using the same oligo-dr primer and a 5'-primer which includes common 4-5 nucleotide sequence combinations, e.g. T11785. After gel electrophoresis of the products, bands unique to anergised gel electrophoresis of the products, bands unique to anergised non-anergised cells are excised, eluted, amplified, cloned and sequenced. Genes and proteins (and corresponding antibodies) arising from this procedure may be used e.g. in monitoring

```
The partial CDNA clone AP162 was 1st isolated from a human adult placenta cDNA clone AP162 was 1st isolated from a human adult placenta cDNA library. The partial cDNA clones AM931, AM610, AM340, AM282, AK647, AK533 and AK296 were 1st isolated from a human feetal kidney cDNA library. The partial cDNA clones H617 and BB9 were 1st isolated from a human peripheral blood monocyte cell (Th1 cor Th2) cDNA library. The partial cDNA clone AM191 was 1st isolated from a human ovary (PA-1 teratocarcinoma) cDNA library. The partial cDNA clones AT211, AT205 and AT319 were 1st isolated from a human clones AT211, AT205 and AT319 were 1st isolated from a human clones AS34 and AS32 were 1st isolated from a human foetal brain cDNA library. The partial cDNA clones AS34 and AS32 were 1st isolated from a human foetal brain cDNA library. The partial cDNA clone AR260 was 1st isolated from a human adult retina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library. The partial cDNA clones K640 and K39 call tretina cDNA library.

PS Claim 27; Fig 3A-D; 73pp; English.

CC This DNA encodes a human DnaJ-like protein, HSPJ2. The invention provides two human DnaJ-like proteins which are heat shock proteins J1 and J2

CC two human DnaJ-like proteins which are heat shock proteins J1 and J2

CC (HSPJ1 and HSPJ2) and nucleic acid sequences encoding the proteins. Host CC production of recombinant proteins. Recombinant HSPJ1 and HSPJ2 are used to traise Ab, therapeutically and to screen for specific binding agents. CC Antagonists are used to treat or prevent a wide variety of solid cancers, leukaemia and lymphoma; immune disorders (typical of many disclosed are acquired immune deficiency syndrome, allergy, asthma, Crohn's disease, CC diabetes mellitus, multiple sclerosis, rheumatoid arthritis, microbial cor prevent tissue damage, e.g. in cases of ankylosing spondylitis, heart attack, ischaemia, UV exposure, insulin-dependent diabetes and for wound fragments of the nucleic acids are used as primers and probes for detecting and quantifying the HSPJ-encoding nucleic acid in usual CC hybridisation and/or amplification assays, therapeutically as antisense, triplex-forming or ribozyme molecules, and for chromosome mapping.

This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and pept ulcer diseases, e.g. gastric and duodenal ulcers. They can also be use for the production of antibodies. The products can also be used for the production of antibodies. The products can also be used for many diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (HUMA-) HUMAN GENOME SCI INC.

**R20500-21243** represent polynucleotide sequences from the genome of X20500-21243 represent polynucleotide sequences for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detection diseases related to Borrelia infections in animals, and for the production of biosynthetic products such as enzymes.

Disclosure; Fig 2; 31pp; English.

The sequence encodes a mouse cysteine string protein isolated from mouse T-cell clones 11.3.7 and 12.2 by a new procedure for identification of genes associated with anergy. The protein is expressed in restling T-cells but not in anergic T-cells. To isolate proteins of this type, differential display is first performed by generating CDNA from polyA+ mRNA with an oligo-dr primer with 2 variable anchor nuclostides at the 3'-end, e.g. mail of the contact of the cont

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence encodes a human cysicine string protein, the absence of which is associated with anergy in T-cells. Genes with at leas 20 Me which is associated with anergy in T-cells. Genes with at leas 20 Me with a probes for detection of the anergic state, and may be 20 used as probes for detection of the anergic state, and may be 21 merformed by generating cDNA from polyA+ mRNA with an ollgo-dr 22 primer with 2 variable anchor nucleotides at the 3'-end, e.g. 21 mer with 2 variable anchor nucleotides at the 3'-end, e.g. 21 mer with 2 variable anchor nucleotides at the 3'-end, e.g. 21 mer with 2 variable anchor nucleotides at the 3'-end, e.g. 21 mer with 2 variable anchor nucleotides at the 3'-end, e.g. 21 mer with 1 mer and 2 mergised or 2 using the same oligo-dr primer and a 5'-primer which includes 2 common 4-5 nucleotide sequence combinations, e.g. 211785. After 2 common 4-5 nucleotide sequence combinations, e.g. 211785. After 2 common 4-5 nucleotide sequence was bands unique to anergised or 2 non-anergised cells are excised, eluted, amplified, cloned and 2 sequenced. Genes and proteins (and corresponding antibodies) autoimmune disease, organ transplantation, vaccine 2 effectiveness, and in drug screening.

Sequence 672 mer and in drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15206
          The sequence is that encoding a secreted protein from a human fetal kidney clone AM610. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth activity, haemost activin/inhibin activity, chemotactic/chemokinetic activity, haemost
                                                                                          Disclosure; Pages 55-56; 76pp; English. The sequence is that encoding a secrete kidney clone AM610. Such a sequence is

PT New polynucleotides encoding human secreted proteins - derived from PT e.g. human blood, kidney, foetal lung, placenta, testes, brain, PT ovary, pituitary, retina and coolon cDNA libraries
PS Claim 1; Page 234; 633pp; English.

CC This sequence represents an expressed sequence tag (EST), and is a CC polynucleotide of the invention. The polynucleotides of the invention are CC all secreted EST sequences isolated from a variety of human tissue CC sources. The EST sequences and proteins encoded by them are predicted to CC treating, preventing or ameliorating medical conditions in humans and CC animals, although no supporting data is given. Suggested activities of include nutritional activity, immune stimulating or suppressing activity, family, land activity, haemostatic CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Вþ
                                                                                                                                                                                                                                                            responsible for antiviral agents which have little effect on mon-infected cells - by determining whether the agent interacts with a virus or cellular component and allows or prevents referential translation of viral RNA.

Example 6; Page 168-69; 195pp; English.

This sequence represents the influenza virus p58 cDNA. This sequence was isolated using probes based on tryptic peptides derived from p58.

These probes were used to screen a cDNA library from MDBK cell line made in lambda Zap II vector. The initial clone contained a long open reading frame but no termination codon suggesting that the 3' end was missing. The 3' end was isolated by RACE-PCR. This allowed construction of the full length p58 cDNA containing 1680 bp.

This is the nucleotide sequence of the gene encoding the bovine P58 protein, a cellular 58 kD protein purified from influenza-infected cells. The protein is used to reduce the activity of a PKR protein (e.g. W36139) in a screening method for identifying anti-tumour agents by measuring PKR activity in a system before and after adding a test agent, where an increase in PKR activity indicates that the agent is an anti-tumour agent, especially useful for the prevention and/or treatment of neoplasms. PKR is an interferon-inducible cytoplasmic Ser-Thr specific protein kinase which can also be activated by double stranded RNA. PKR is active in cell growth and differentiation by regulating protein synthesis, and thus has been suggested to function

Claim 1; Page 969-972; 3271pp; English.

CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences

CC of the invention. The DNA sequences are recorded on a computer readable

CC medium, preferably selected from a floppy or hard disk, random access

CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using

CC that protein-encoding or regulatory regions of commercial, therapeutic or

CC industrial importance can be obtained. Specifically, sequences which are

CC likely to encode antigens have been identified and these polypeptides can

CC saureus in a sample. Saureus infection. The

CC saureus in a sample. Saureus is implicated in numerous human diseases,

CC skin and surgical wound infections, scalded skin syndrome, toxic shock

CC syndrome, etc. Organisms transformed with the DNA sequences can be used

CC (and their fragments) are useful as primers or probes for isolating

CC computer readable medium.
